

The background of the image is a dark, textured surface, possibly black or very dark brown. Scattered across this surface are various ornate metal hardware pieces, likely brass or bronze, which are slightly out of focus. These pieces include decorative knobs, pulls, and escutcheons with intricate scrollwork and floral designs. One prominent piece in the lower-left is a large, circular, sunburst-style knob with a central mosaic-like pattern. Another piece in the upper-left has a curved, leaf-like design. The overall aesthetic is classic and elegant, suggesting a high-quality, vintage-inspired hardware collection.

HARDWARE

It is the hardware that brings all the other details together to create the final completed work of art. Most of our hardware is cast in brass and distressed to achieve the appearance of an item that has been in use for hundreds of years.

Using various casting methods; sand casting, flask casting and lost wax casting, we produce hardware the same way a jeweler make a piece of intricate fine jewellery.

18,000 different designs of hardware in total.

SAND CASTING

The sand casting process has remained largely unchanged for thousand of years. We recommend sand casting for projects that might be price sensitive. Due to its simplicity, sand casting is the most efficient method of casting.

However there are restrictions to the detail and complexity of the design due to the mould making process.

3. ROUGH CASTING

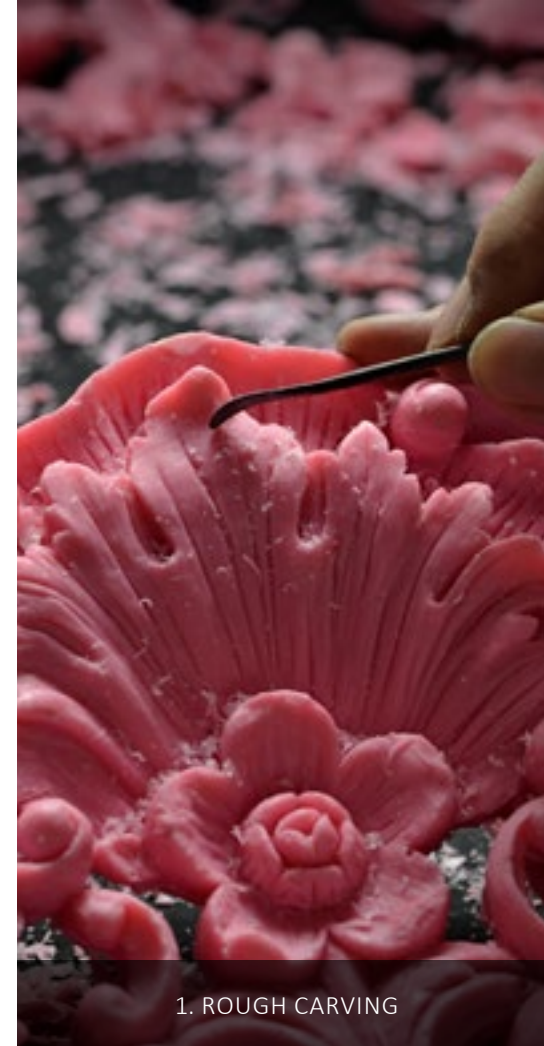

2. POURING BRASS

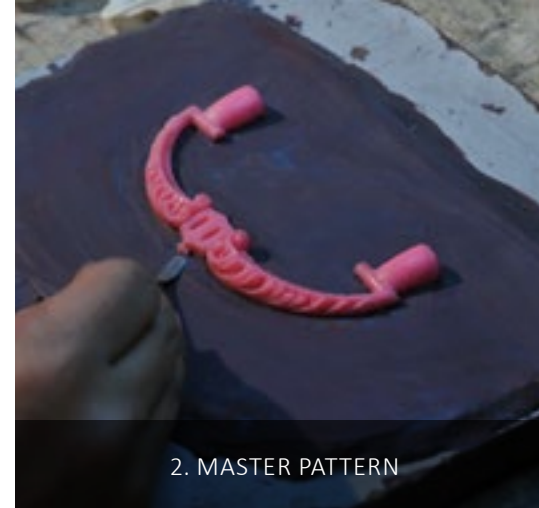

3. ROUGH CASTING

CERAMIC SHELL CASTING

For more complicated shapes and detail we would recommend ceramic shell casting. Shell casting uses a slurry and refractory material to build a shell around the wax pattern. Once dry the wax is melted and drawn out of the shell leaving a hollow cavity into which the metal is poured. Once cool the shell is removed leaving a perfect copy of the original pattern in your choice of metal. Ceramic shell provides an excellent finish surface and greater dimensional stability than sand casting.
